1 The function

Simplifying the programming question :

let us give to find $((1+k)(1+2k)(1+3k)(1+ck))$ where c is the largest integer such that $ck \leq n$. The function $f(k, n) = \prod_{i=1}^c (1+ik)$. As the highest value of c can be $\lfloor n/k \rfloor$.

So we have to find the value of

$$\prod_{i=1}^{\lfloor n/k \rfloor} (1+ik)$$

And

$$\prod_{i=1}^{\lfloor n/k \rfloor} (1+ik) = k^{\lfloor n/k \rfloor} \cdot \frac{\Gamma(\lfloor n/k \rfloor + \frac{k+1}{k})}{\Gamma(\frac{k+1}{k})}$$

The C++ code will be :

```
#include<bit/stdc++.h>
#include<cmath>
using namespace std;
int main()
{
    int n , k;
    cin>>n>>k;
    double p ;
    p = (pow(k,n/k) * tgamma((n/k)+((k+1)/k)) )/tgamma((k+1)/k)
    cout<<p;
}
```
